

ABSTRACT

A display board assembly comprising a display board and a frame coupled to the display board. The frame defines a gap dimensioned to receive and hold a sheet. The frame may include a body engageable with the display board. The body may further
5 include a first projection defining a first surface and a second projection defining a second surface positioned to face the first surface, wherein the first and second surfaces define the gap dimensioned to receive and hold a sheet. The body can define a longitudinal direction and a transverse direction substantially perpendicular to the longitudinal direction. The display board assembly can be used to post a sheet by inserting a sheet into the gap
10 substantially along the transverse direction.
